## TELESCOPIC RAILS <br> LSS, LST AND LSE

Nadella telescopic rails are ball guided and very compact and flexible products. Made entirely of steel, with profiles cold drawn and raceways induction hardened, enables you to move heavy loads while maintaining excellent rolling features thanks to the robust ball cage interposed between the sliding elements.

The product is composed by the external drawn profile, with C shaped section, the internal slider and the ball-cage:

- Linear guide cold drawn in bearing steel with high durability; internal concave raceways with gothic arch shape, induction hardened for a high wear resistance and durability. The rails are supplied with a standard surface treatment of white zinc plating.
- Internal slider in bearing steel with high durability; internal concave raceways with gothic arch shape, induction hardened for a high wear resistance and durability. Sliders are supplied drilled with a surface treatment of electrolytic white zinc plating.
- Bent steel plate ball-cage with surface treatment of white zinc plating which holds the rolling elements consisting of steel bearing balls, which allows the reciprocal sliding of the elements; the high diameter and the narrow pitch between the balls allow a very high load capacity.

The raceways have a gothic arch shape which increases the load capacity of the system compared with the v shaped raceways.

The proposed range includes three lines:

- Semi-telescopic rails LST, where the slider can escape for more than half its length.
- Telescopic rails LSE, that allow a stroke equal to the length of the closed rail, thanks to the intermediate element that acts as a bridge between the two sliders

- LSS rails, with one or more sliders which run inside the rail.

Our rails are available in two sizes, 28 and 43, and can be supplied in the standard version according to the present catalogue, or in several different configurations according to the requiring of the applications.

## SURFACE TREATMENT

LSS and LST rails are supplied with a surface treatment of electrolytic white zinc plating on all the components (slider, rail and ball-cage). Zinc-plating treatment process is done after drilling the elements.
On request other surface treatments can be supplied (chemical nickel plating, suffix NW, phosphating).

Balls, in bearing steel, hardened, don't have any surface treatment. Upon request the rails can be equipped with balls in stainless steel.

## LUBRICATION

For a proper exercise and to ensure an adequate lifetime, a film of lubricant must always be guaranteed in the contact area between the balls and the raceways of the elements (relubricate the raceways periodically according to the own specific working cycle and the environment, in order to always guarantee a layer of lubricant in the contact area between balls and raceways).The guides are provided with raceways lubricated with a bearing grease with a base of soap barium, which allows to work in a temperature range between $-20^{\circ} \mathrm{C}$ and $+120^{\circ} \mathrm{C}$. Please contact our technical support if you plan application with higher temperatures

We recommend the lubrication of the raceways at least every 50000 cycles.

For extreme working temperature, please contact our Technical service.

# TELESCOPIC RAILS <br> LSS, LST AND LSE 

LUBRICATION AND TEMPERATURE
We recommend to use the rails with lubrication on the raceways. During production the rails are equipped with a lubricant which allows to work in a range of temperatures between $-20^{\circ} \mathrm{C}$ and $+120^{\circ} \mathrm{C}$. Out of this range suitable mounting precautions should be evaluated: use of a lubricant for extreme temperatures, mounting with increased clearance, to remedy to the thermal expansion.

Maximum working temperature is $170^{\circ} \mathrm{C}$, for higher temperature the use should happen in consideration of a reduction of the load capacity (at high temperatures the hardened raceways undergo a tempering process, reducing the surface hardness of the elements).

## MAXIMUM SPEED

We suggest to work at speed not higher than $0.5 \mathrm{~m} / \mathrm{s}$ in order to have a correct functioning (for rails LSE maximum speed $0,3 \mathrm{~m} / \mathrm{s}$ ).

These products are suggested for applications with small inversion frequencies and accelerations (please consult the following «Suggestions for a correct mounting» paragraph).

## LOAD CAPACITIES

Guide rails with ball cage have preferential load capacity with the mounting on the side (major axis).
Ideal mounting configuration is realised with two parallel guide rails, with the load to be moved uniformly distributed on the moving elements. Mounting of the guide rail to the structure and of the external load to the sliders should involve all available holes of the components.

Load capacities are expressed in $N$ (Newton), torque load capacities are expressed in Nm, refer to the Cartesian axes with origin in the centre of the slider and are valued according to standard ISO 147282. Tables of load capacities in the following pages refer to a single slider and are to be intended as maximum static admissible loads for a smooth operation.

In order to choose the correct guide rail we suggest to use the product with the appropriate load capacity by calculating the safety factor Fs. With more loads and torques acting simultaneously in different directions the check of the loads shouldn't be on the single component, but the contemporary action of all the components should be considered (Peq).

$$
F_{\mathrm{s}}=\left|\frac{\mathrm{C}_{\mathrm{y}}}{\mathrm{P}_{\text {eq }}}\right|>1
$$

$$
P_{e q}=P_{1}+\left(\frac{P 2}{C_{z}}+\frac{M 1}{M_{x}}+\frac{M 2}{M_{y}}+\frac{M 2}{M_{z}}\right) \times C_{y}
$$

with:

Peq equivalent load in $Y$ direction resulting from the combination of all the loads and torques acting contemporary on the slider load applied in the middle of the slider in $Y$ direction
P2 load applied in the middle of the slider in $Z$ direction M1 torque applied in the middle of the slider around $X$ axis
M2 torque applied in the middle of the slider around Y axis
M3 torque applied in the middle of the slider around Z axis Cy maximum admissible static load capacity in $Y$ direction Cz maximum admissible static load capacity in Z direction
Mx maximum admissible static torque load capacity around $X$ axis
My maximum admissible static torque load capacity around Y axis
Mz maximum admissible static torque load capacity around $Z$ axis

## TELESCOPIC RAILS <br> LSS, LST AND LSE

## LIFETIME

Lifetime of the guide rail is the maximum stroke (in km for rails LSS) or maximum number of cycles (for rails LST and LSE), that the guide rail will be able to reach before the appearances of plastic deformation on the raceways.

For rails LSS

$$
L_{k m}=100 \times\left(\frac{C_{100}}{P_{\text {eq }}} \times \frac{1}{f}\right)^{3}
$$

For rails LST and LSE

$$
L_{\text {cycles }}=100000 \times\left(\frac{C_{\text {dyn }}}{P_{\text {eq }}} \times \frac{1}{f}\right)^{3}
$$

with:

C100 dynamic load in $Y$ direction [ N ], valued according to standard ISO 14728-1 for the calculation of the lifetime in km (rails LSS)

Cdyn dynamic load in Y direction [ N ], valued according to standard ISO 14728-1 for calculation of the lifetime in cycles (rails LST and LSE)

Peq equivalent load in $Y$ direction resulting from the combination of all the loads and torques acting contemporary on the slider (see formula above)
f application coefficient

Smooth operation at low speed at constant load without shocks

$$
f=1-1.2
$$

Smooth operation with load variation

Operation with small shocks and vibrations

$$
f=1.5-2
$$

High accelerations, shocks and vibrations

$$
f=2-4
$$

## DEFLECTION

The deflection is the elastic deformation you can register at the edge of the opened rail when a load is applied.

With semi-telescopic rails LST, that can partially exit from the rail, the deflection will depend almost exclusively on the rigidity of the structures connected to the guide elements.

For telescopic rails LSE, please refer to the values of deflection written in the tables of the load capacities and which refer to the maximum load (Cy) applied in the middle of the opened slider. For applied loads inferior to the maximum load capacity, please reduce the deflection proportionally.

## SUGGESTIONS FOR A CORRECT MOUNTING

In guide systems based on ball-cage, the sliding occurs thanks to the simultaneous movement of the slider and of the ball-cage: the slider, moved by a drive system or manually, sets in motion the ball-cage, which will cover half of the stroke done by the slider, until reaching the end-stop.

During operation, with the succession of working cycles and consequent motion reversals, imperceptible displacements of the ballcage, in relation to the position of the slider, occur, due to the inertia to the movement of the ball-cage that doesn't engage immediately when the slider starts its race.
This process, that is defined displacement and leads to a gradual reduction of the stroke and consequent dragging of the ball-cage on the raceways, can be slowed down by a correct use, with races constantly up to the end stops and low speed and acceleration. The restoration of the proper functioning must be done by setting a forced cycle up to the end stop: when the movement of the slider is commanded by a drive system, we recommend to provide a peak motor torque 10 times higher (friction coefficient in normal condition is 0,01 ).

Guide systems based on ball-cages are recommended for movement on the horizontal plane. Movement in the vertical direction is not recommended because the ball-cage tends to fall by gravity, accelerating the process of displacement.

Providing an external end stop is highly recommended in order not to discharge on the screw of the internal stop the arrest of the machine.

## TELESCOPIC RAILS <br> LSS, LST AND LSE

During the mounting of LSS and LST rails we suggest to work the holes in the support in order to avoid any interference between the screws and the sliders (see table below).

| Size | Chamfer |
| :--- | :--- |
| LSS28, LST28 | $1 \times 45^{\circ}$ |
| LSS43, LST43 | $1.5 \times 45^{\circ}$ |

## EXTERNAL END STOPS

Provide external end stop in order not to discharge on the screws of the internal stop the arrest of the machine.

Mounting screws of resistance class 10.9 are recommended for mounting.

## FRICTION COEFFICIENT

The friction coefficient in normal condition is equal to 0,01 .

When the movement of the slider is commanded by a drive system, we recommend to provide a peak motor torque 10 times higher than the standard required due to the process of displacement (see the "Suggestion for a correct mounting" paragraph).

For telescopic rails LSE the force necessary for closing the rails and let the slider go back in central position is increased from the deflection due to the extraction of the moving elements.

NOTES

## PART EXTENSIONS

LST

LST 28

LST 43

Part extensions LST of Nadella allow the partial extraction of the slider which escapes for more than half its length from the edge of the rail, while maintaining a smooth and regular movement through the interposition of a robust metal ball-cage. The perfect solution for all applications requiring a protruding extraction.

LST guide rail is available in two sizes, LST28 and LST43, and several standard lengths (on request different rail lengths can be provided that will be managed as special items).

## LOAD CAPACITIES

Part extensions with ball cage have preferential load capacity with the mounting on the side (major axis).
Ideal mounting configuration is realised with two parallel guide rails, with the load to be moved uniformly distributed on the moving elements. Mounting of the guide rail to the structure and of the external load to the sliders should involve all available holes of the components.

Ideal mounting configuration with two parallel LST, load in preferential direction applied in the middle of the sliders.

## DOUBLE STROKE

In order to obtain the double stroke and allow the slider to escape in both directions, please remove the screw at the edge of the rail.

Remove the screw at the edge
of the rail for double stroke.

Load capacity for single rail
${ }^{(1)}$ Cdyn is used for lifetime calculation

## DOUBLE STROKE

In order to obtain the double stroke and allow the slider to escape in both directions, please remove the screw at the edge of the rail.

## FULL EXTENSIONS

LSE

Full extensions LSE allow a stroke equal to the length of the closed rail, thanks to the intermediate element that acts as a bridge between the two sliders.
LSE guides allow a smooth and regular movement and are the perfect solution for all the applications requiring a total telescopic extraction.

LSE guide rail is available in two sizes, LSE28 and LSE43, and several standard lengths (on request different rail lengths can be provided that will be managed as special items).

## LOAD CAPACITIES

Full extensions with ball cage have preferential load capacity with the mounting on the side (major axis). Ideal mounting configuration is realised with two parallel guide rails, with the load to be moved uniformly distributed on the moving elements. Mounting of the guide rail to the structure and of the external load to the sliders should involve all available holes of the components.

## AVAILABLE HOLE CONFIGURATIONS

LSE full extensions are available with countersunk holes (suffix V) and threaded holes (suffix F), or in the mixed version (suffix M), with one slider with countersunk holes and one slider with threaded holes.

LSE28-...V
LSE43-...V

Code example: LSE28-450 V, full extension LSE size 28, closed length 450 mm , countersunk holes in both sliders

Code example: LSE43-770 F, full extension LSE size 43, closed length 770 mm , threaded holes in both sliders.

LSE28-...M
LSE43-...M

Code example: LSE43-1170 M, full extension LSE size 43, closed length 1170 mm , threaded holes on one slider and countersunk holes in the opposite one.

## DOUBLE STROKE

In order to obtain the double stroke and allow the slider to escape in both directions, please remove the screw at the edge of the intermediate element.

Remove the screw at the edge of the rail for double stroke.

Ideal mounting configuration with two parallel LSE, load in preferential direction applied in the middle of the sliders.

Load capacity for single rail
${ }^{(1)}$ Cdyn is used for lifetime calculation

DOUBLE STROKE
In order to obtain the double stroke and allow the slider to escape in both directions, please remove the screw at the edge of the intermediate element.

## LINEAR GUIDES <br> LSS

LSS 28

LSS 43

With LSS linear guides the movement is achieved through one or more sliders which run inside the guide rail. Several different combinations are possible and the final product can be configured out according to the application requests.

## LSS WITH SINGLE SLIDER

In the standard configuration the final product is composed by the guide rail inside which run a single ball-cage and a single slider.

## LSS WITH TWO INDEPENDENT SLIDERS

This configuration allows the movement, inside the guide rail, of two ball-cages, inside each ball-cage one or more sliders. The two ballcages can run in opposing directions.

LSS WITH TWO SYNCHRONISED SLIDERS
This configuration allows the movement inside the ball-cage of two synchronized sliders.

LSS43-total length L-stroke-2xlength of the slider
