

NEEDLE THRUST BEARINGS ROLLER THRUST BEARINGS

NADELLA

Technical features

Needle thrust bearings-Roller thrust bearings

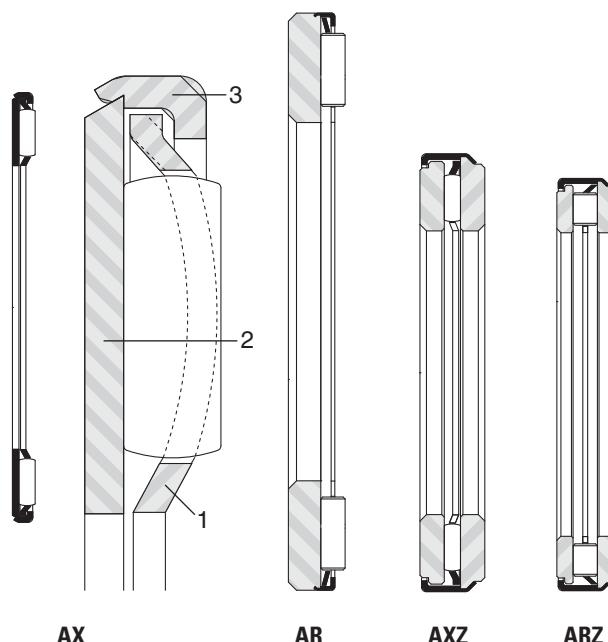

The rolling elements of a thrust bearing are retained and guided in radial pockets within the cage (1). The latter is itself retained in relation to the plate (2) by means of a steel ring (3). This assembly of parts is easy to handle and install and provides a high axial load capacity whilst occupying minimal space.

The design of Nadella thrust bearings serves to reduce to a minimum the friction between the rolling elements and the cage that guides them. Given correct installation and adequate oil lubrication, the coefficient of friction will be between 0.003 and 0.004 for needle thrust bearings and between 0.004 and 0.005 for roller thrust bearings.

This result is due principally to the design of the one-piece steel cage (1) which has a special curvature that guides the rolling elements by their ends along their centre-lines.

Thus, the loads imposed on the cage by the rollers cannot create components parallel to the axis of rotation and therefore no increase in internal friction is generated, and correct operation without wear or overheating is ensured. In addition, this special curvature gives the steel cage great rigidity and being relatively thin provides maximum space for the lubricant.

TYPES OF THRUST BEARINGS

THRUST PLATES

The plate incorporated in the thrust bearing is made from hardened bearing steel and forms one of the raceways for the rolling elements. The opposing raceway is generally provided by a separate thrust plate of similar design supplied by Nadella. When the thrust bearing is centred by the revolving part, the thrust plate must be centred by the stationary part and vice versa. If the revolving part and the stationary part are noticeably eccentric to each other, the thrust bearing with integral plate must without exception be centred by the revolving part (see mounting examples on pages 140 and 141). The second raceway for the rolling elements may also be formed by the face of a shoulder or an inserted ring, provided these have the correct geometrical dimensions and hardness.

THRUST BEARINGS WITH THRUST PLATE

Thrust bearings type **AXZ** and **ARZ** have two thrust plates retained by a steel ring giving protection against the entry of dirt and metal particles whilst at the same time assisting retention of the lubricant.

OPERATION

When the ring of rolling elements begins to rotate, it is automatically centred in relation to the shaft axis. Thus the thrust bearing does not need to be precisely centred by the incorporated plate. Hence it is possible to align the bearing (on the shaft or in the housing) allowing wide tolerances to be used and without surface hardening. This enables costs to be reduced. The same feature applies to centring of the thrust plate.

Thrust bearings with incorporated plate	Separate thrust plates	Thrust bearings with plate and thrust plate incorporated
Needle thrust bearings AX thin series AX thick series	CP thin series CP thick series	Needle thrust bearings AXZ thick series
Roller thrust bearings AR light series		Roller thrust bearings ARZ light series
AR heavy series	CPR heavy series	ARZ heavy series

Needle thrust bearings with a thin plate are of minimal thickness and are particularly economic to use. They should be considered whenever the degree of support and rotational accuracy permits.

Technical features

Needle thrust bearings-Roller thrust bearing

THICKNESS AND AXIAL RUN-OUT TOLERANCES

	Internal Ø D_{c1} mm	Thickness tolerance μm	Axial run-out max

Thrust plates (thick)	$D_{c1} \leq 120$ $120 < D_{c1} \leq 180$ $180 < D_{c1} \leq 250$	+ 50/- 50 + 50/- 100 + 50/- 150	5* 7* 10*

(1) Under min. load of 150 N

(2) Under min. load of 250 N

SUPPORTING FACES

For smooth running operation of needle or roller thrust bearings, it is necessary that their supporting faces should be parallel.

For a thrust bearing with intermediate thrust plate, the permissible degree of deviation from true parallelism between the two supporting faces should be no more than 1 min. (or approx. 0.3 per 1000).

For a thrust bearing without intermediate thrust plate, the deviation must be no more than 1 min. 30 sec. (or approx. 0.45 per 1000).

Thin needle thrust bearings and thin thrust plates must be supported on a flat, rigid and continuous face throughout the area of circulation of the needles bounded by dimensions E_b and E_a .

Thick needle thrust bearings and thick thrust plates can be supported on a more restricted or discontinuous shoulder, provided that the deflection of the plate under load does not endanger the smooth operation of the thrust bearing or the axial run-out required.

Since roller thrust bearings generally run under considerable loads, their incorporated plate and thrust plate should be supported on a shoulder covering the whole area of circulation of the rollers bounded by dimensions E_b and E_a .

Where an application does not involve the use of a thrust plate, the surface forming the second raceway must:

- extend at least across the whole area of circulation of the rolling elements between dimensions E_b and E_a ;
- possess a suitable surface finish ($\leq 0.5 \mu\text{m}$ C.L.A.) and sufficient hardness in relation to the load to be supported.

A hardness of 58-64 HRC enables thrust bearings to carry their full load capacity. Lower hardness values reduce the capacities shown in the tables of dimensions (see Technical Section).

TOLERANCES FOR CENTRING SUPPORTS

Centring on the shaft: h10 on dimension D_{c1} for thrust bearings or thrust plates.

Centring in the housing: H10 on dimension D for thrust bearings and dimension d_1 for thrust plates.

LOAD RATINGS

Minimum axial load

Slippage can occur if the applied axial load is too light and the operating speed of the needle thrust bearings is high – particularly if accompanied by inadequate lubrication. For satisfactory operation, a certain minimum load must be applied to a needle thrust bearing which can be calculated from:

$$F_{a \min} = C_0 / 2200 [\text{kN}]$$

Where:

C_0 static load rating [kN]

$F_{a \min}$ minimum axial load [kN]

COEFFICIENT OF FRICTION

In general, the coefficient of friction of a thrust bearing (consisting of a needle thrust bearing and thrust plate) is defined as the friction torque, divided by the product of the applied load and the bearing pitch radius. This coefficient of friction is not a constant value, but will vary considerably with load, speed and lubricant.

Generally, the coefficient of friction becomes smaller as the load is increased, and larger as the speed is increased.

It is suggested that a value of 0.008 as a conservative estimate.

LUBRICATION

Oil is the preferred lubricant for needle thrust bearings and an ample oil flow is absolutely necessary for high speeds or for moderate speeds when the load is relatively high.

When the application must utilize grease lubrication, the needle thrust bearing should be ordered pre-greased.

When the speeds are low and rotation is not continuous, the initial charge of grease may be suitable for the life of the application.

When the speeds are moderate, the designer must provide for frequent re-greasing. Because the needle rollers tend to expel the lubricant radially outward, relubrication passages should be directed to the bore of the cage whether oil or grease is used as the lubricant.

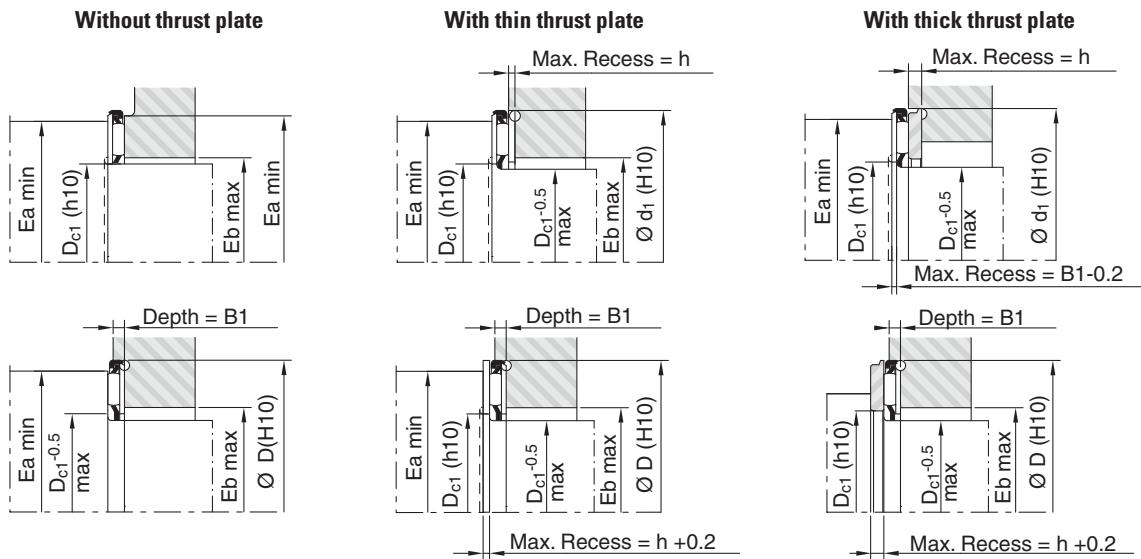

SPECIAL DESIGNS

Needle thrust bearings and thrust plates are made to special dimensions and configurations, as well as from special materials – when quantities permit economical manufacture.

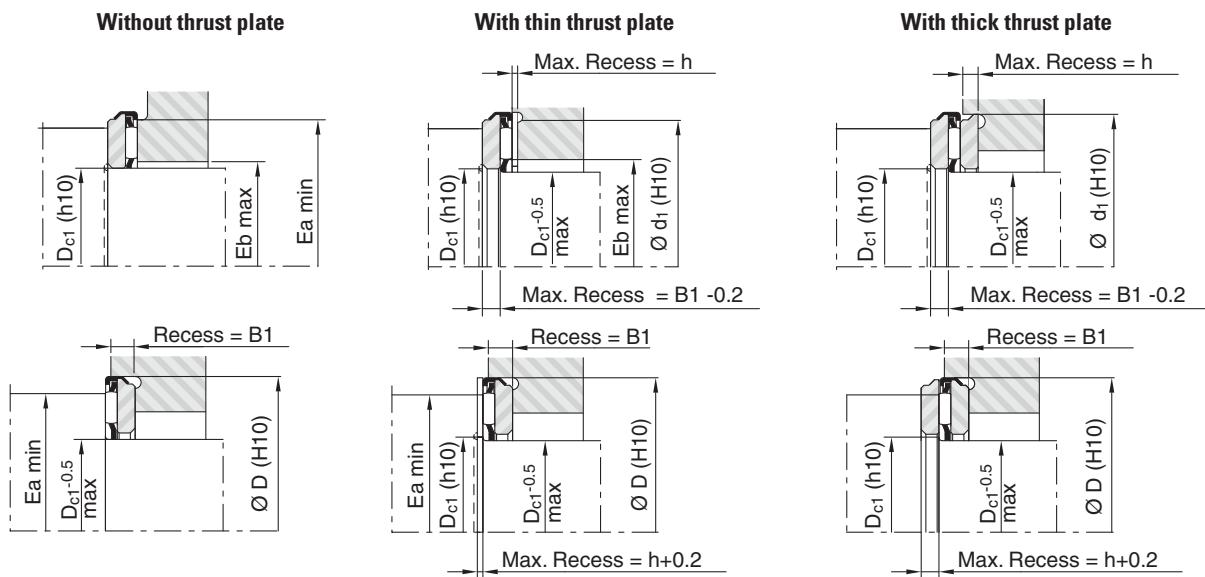

Mounting arrangements

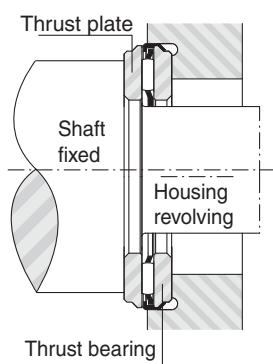

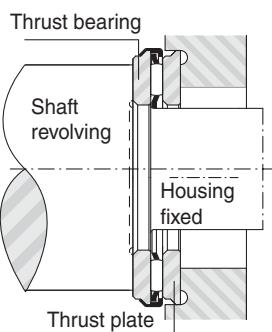

Needle thrust bearings with thin thrust plate

Needle thrust bearings with thick plate or light series roller thrust bearings

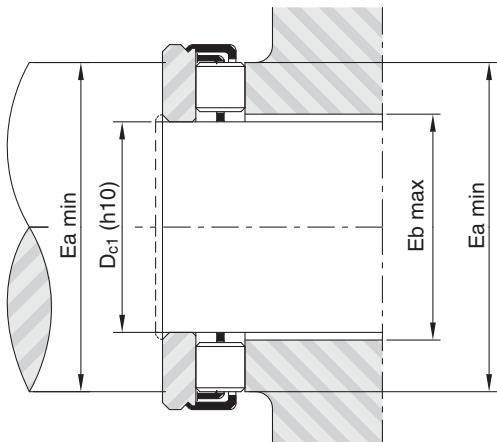

Mounting for eccentric operation

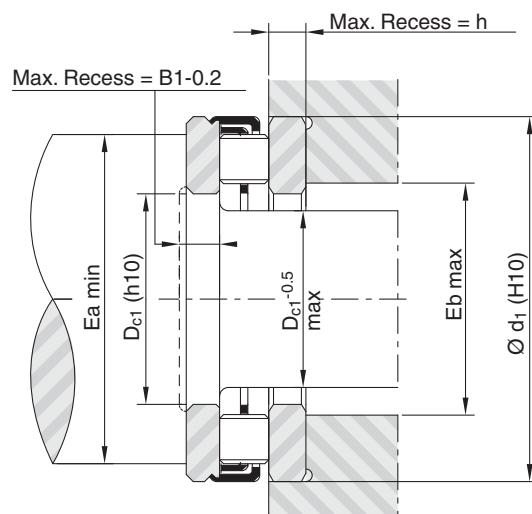

Mounting arrangements

Roller thrust bearings AR heavy series

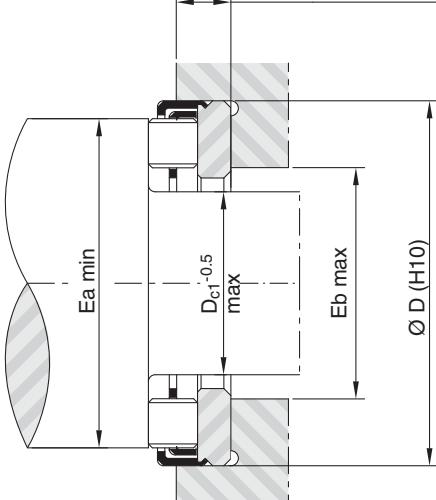

Without thrust plate

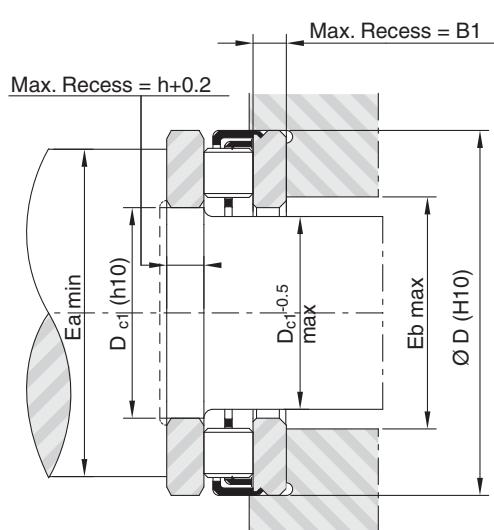

With thick thrust plate

Max. Recess = B1

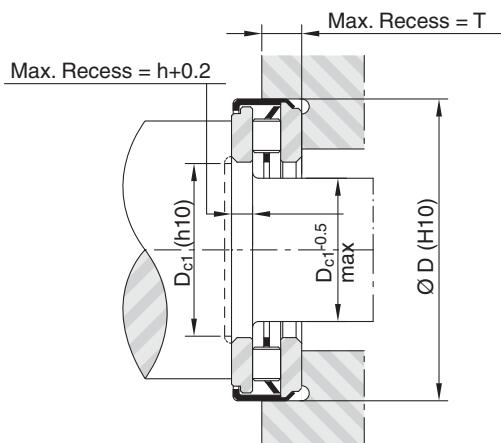

Max. Recess = h+0.2

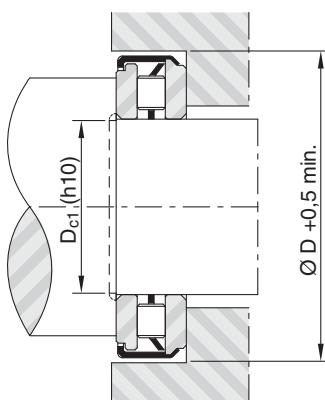

Needle thrust bearings AXZ or roller thrust bearings ARZ

Mounting for high speed rotation

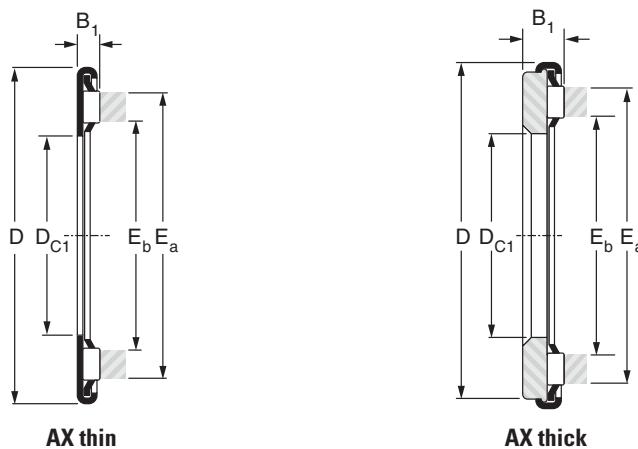

Mounting for slow speed rotation or oscillating motion
